New Article:

Imagine living in a world where every car on the road did not make engine noise. Now imagine living in a world where cars did not give off carbon fumes and the world became much more green. The Renault-Nissan-Mitsubishi Alliance hopes to see this vision. The alliance announced plans to produce 12 new electric models by 2022.

Besides the electric models, the alliance also plans to introduce new forms of public transportation such as autonomous vehicles and “robo-taxis”.

The alliance is taking a huge gamble, as CEO Carlos Ghosn explains that the alliance predicts that governments around the world will continue to restrict gasoline and diesel cars, making drivers more interested in electric cars.

This comes as the Alliance strategizes using the growing reach received after purchasing Mitsubishi. They hope to utilize Mitsubishi and make electric and driverless cars more affordable.
